Precision vs. Significance

Precision and Significance in the Real World

A 1500 kg mass
is approaching
your head at
45.3 m/sec.

Precision

**LOOK
OUT!!**

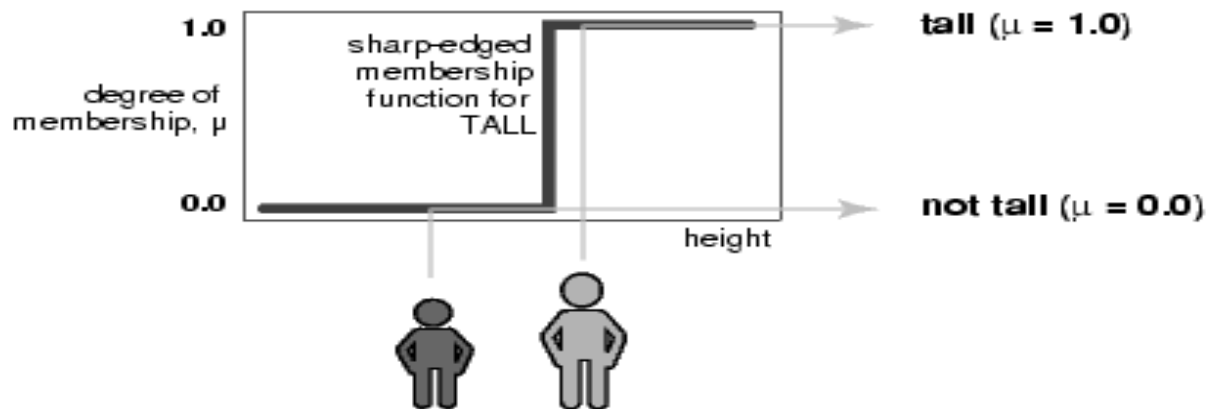

Significance

Conventional Logic

Fuzzy Logic / Human Logic

Basics: Membership Function

Words are inherently imprecise. This imprecision is captured by MF

Basics: IF-THEN Rules

- Example
 - “If falling object looks BIG, then yell ‘Watch Out!’ LOUDLY”
 - “If falling object looks SMALL, then tell him ‘Watch Out!’ CALMLY”
- BIG, LOUDLY, SMALL, CALMLY are defined by membership functions
- Enables fuzzy chip to make decision like humans!

Why VLSI Implementation?

- Speed
 - Needed for Real-time applications
- Scalability
 - Parallel processing of fuzzy rules
- Our Design Goal:
 - General-Purpose VLSI Fuzzy Controller
 - Flexible & Fast (best of both worlds)
 - Analagous to DSP Chip

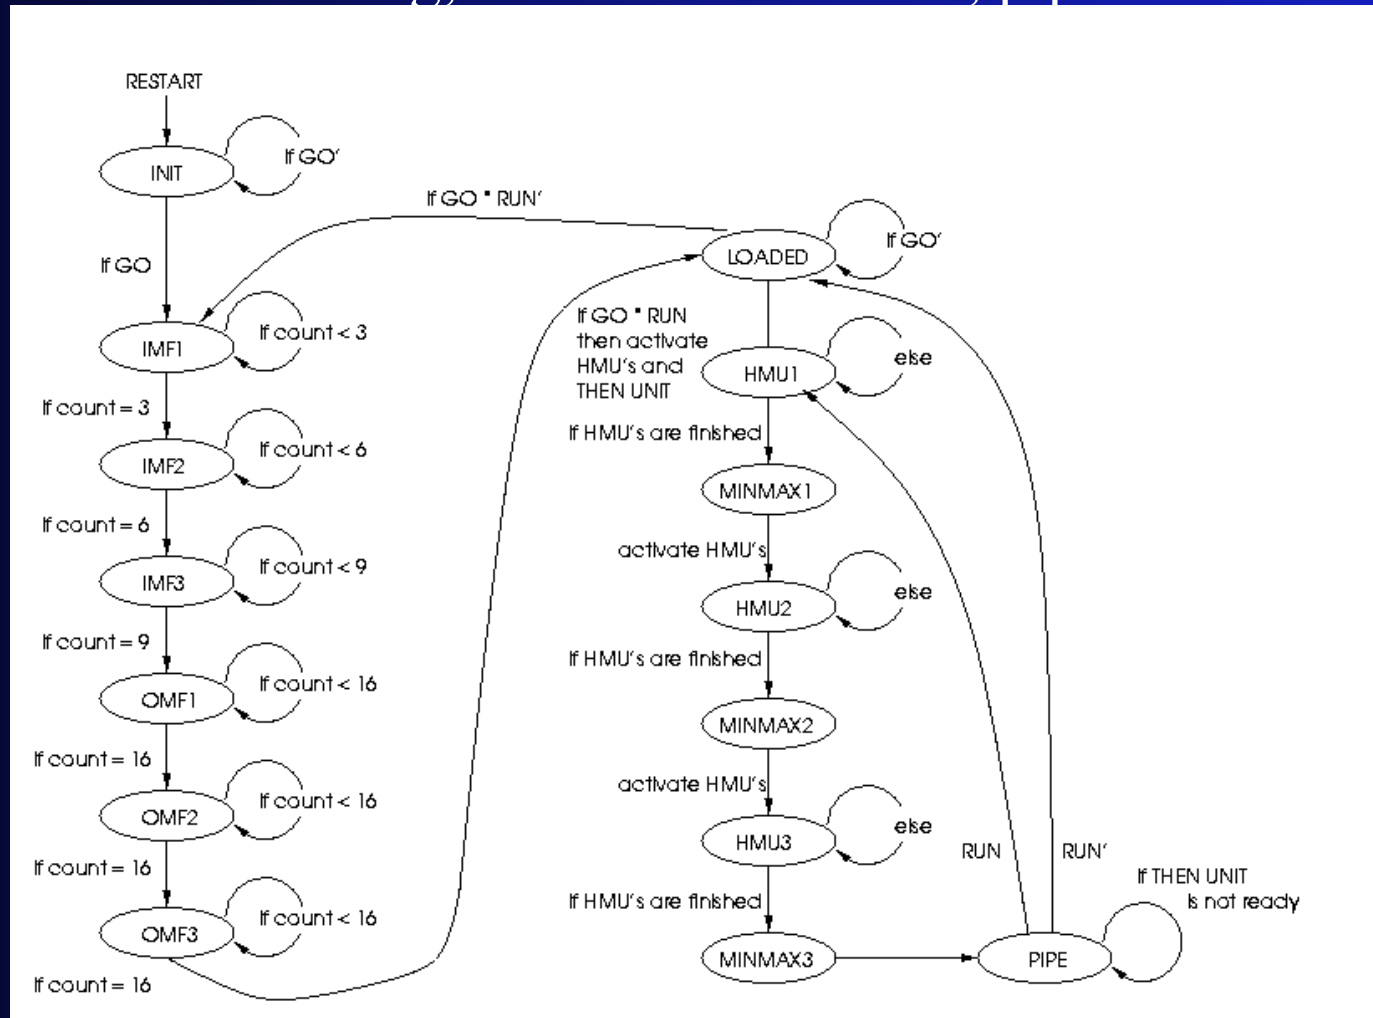

Functional Description

- 2 Input, 1 Output, 3 Fuzzy Rule
- Loadable Membership Functions (MF)
- 2-Stage Pipeline

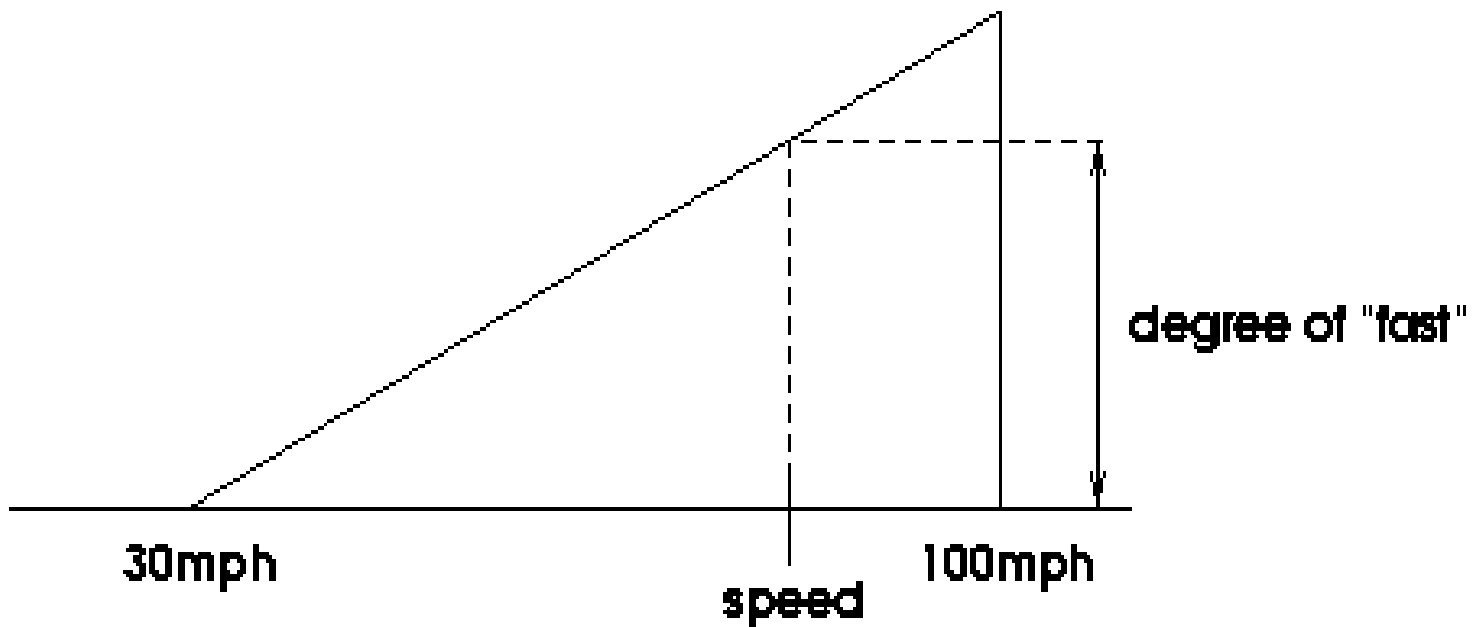

Main PLA

Controls loading, IF & THEN PLA's, pipeline

IF Unit: Purpose

- Evaluates height of intercept (“degree of truth”) for each IF statement

Challenge: How to represent membership function?

- Problem: Space vs. Flexibility
- Possible solution: Lookup Table
 - Pros:
 - Flexible expression of function
 - Fast access
 - Cons:
 - Takes too much space
 - Zero values waste space
 - Not challenging

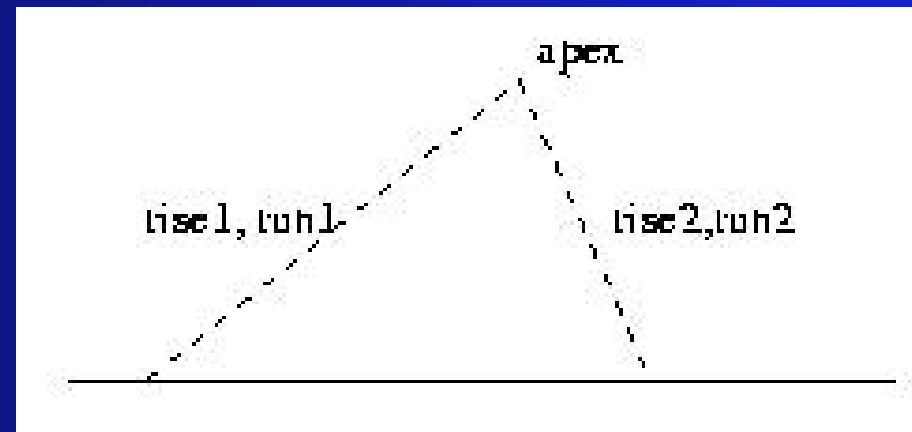

Membership Representation Using a RAM Lookup Table

Access address corresponding to Input
Output its content, the height

Solution: Point-Slope MF

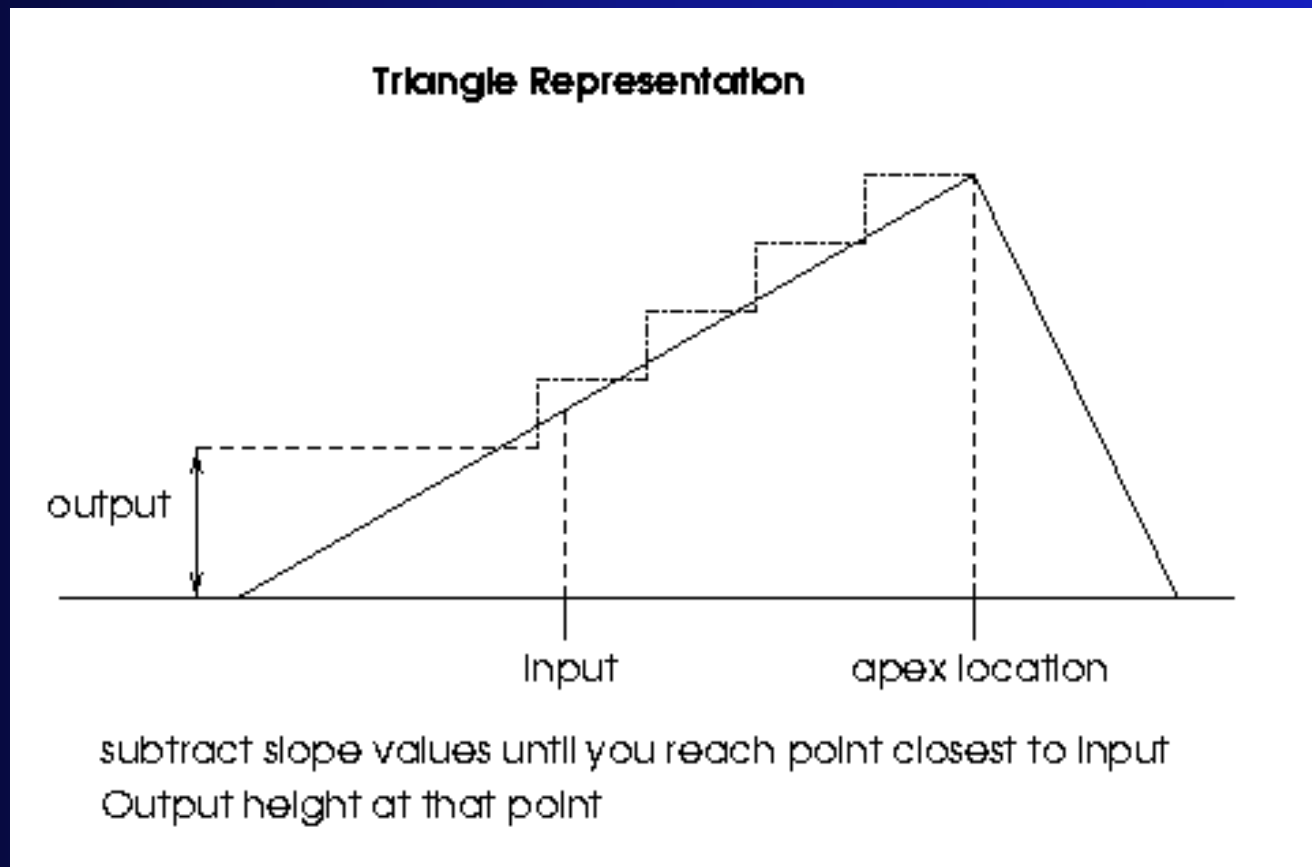

- Our solution:
 - Represent geometric shape with slopes & point
 - Cons:
 - Math hardware required
 - Slower, variable-time calculation
 - Pros:
 - Much less space
 - Represent most MF shapes

Algorithm for Finding Intercept

- Begin at apex, iterate subtractions until x
Result is y (height/degree of truth)

THEN Unit: Purpose

- Find the areas under the “cut” value for each THEN statement and Aggregate into a big MF
- Find Center of Mass for big MF -> final answer!

Challenge: Center of Mass

- Problem: complicated Center of Mass equation -

$$COM = \frac{\sum_{i=1}^{16} x_i y_i}{\sum_{i=1}^{16} y_i}$$

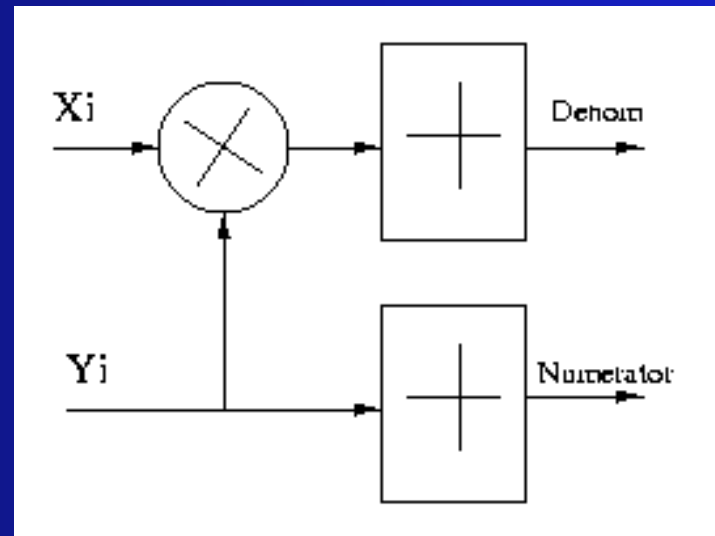

Possible Solution

- Possible Solution: Direct Implementation

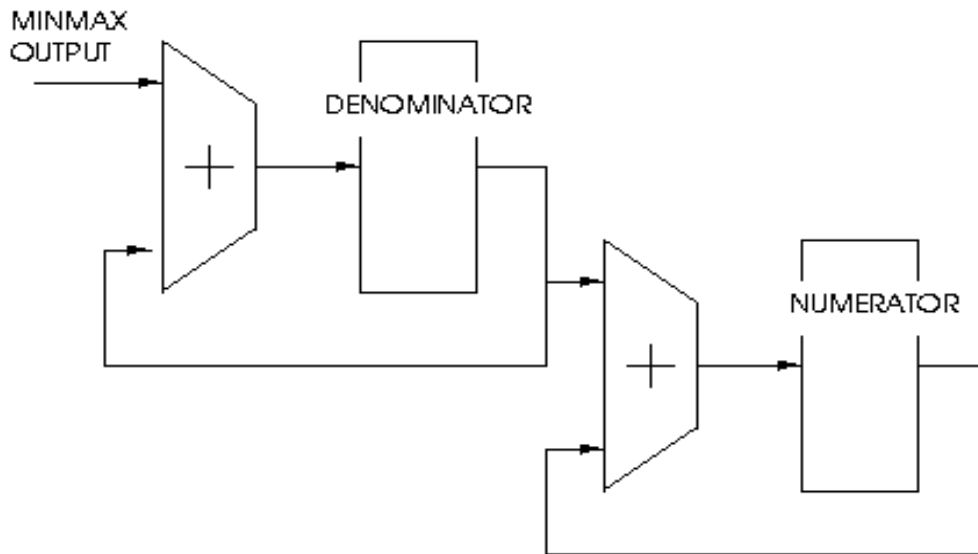

$$COM = \frac{\sum_{i=1}^{16} x_i y_i}{\sum_{i=1}^{16} y_i}$$

- Too much hardware!
- Too slow (multiplication)

Our solution: DoubleLoop Adder

- Calculate Num & Den simultaneously
- No multiplier needed

$$\frac{num}{den} = \sum_{i=1}^{16} x_i y_i / \sum_{i=1}^{16} y_i$$

t	den	num
0	y_{16}	0
1	$y_{16} + y_{15}$	y_{16}
2	$y_{16} + y_{15} + y_{14}$	$y_{16} + (y_{16} + y_{15})$
3	...	$y_{16} + (y_{16} + y_{15}) + (y_{16} + y_{15} + y_{14})$

More on DoubleLoop Adder

- Proof:

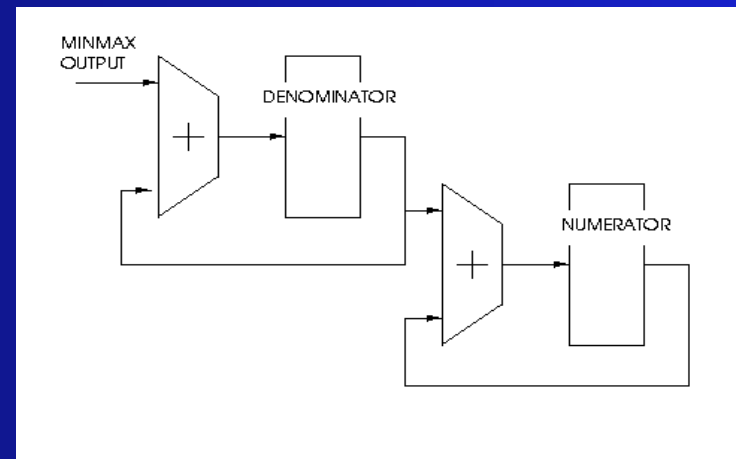

$$\begin{aligned} num &= 16y_{16} + 15y_{15} + 14y_{14} + \dots + 1y_1 \\ &= y_{16} + (y_{16} + y_{15}) + (y_{16} + y_{15} + y_{14}) + \dots + (y_{16} + y_{15} + y_{14} + \dots + y_1) \\ &= y_{16} + (y_{16} + y_{15}) + (y_{16} + y_{15} + y_{14}) + \dots + den \end{aligned}$$

- Pros:

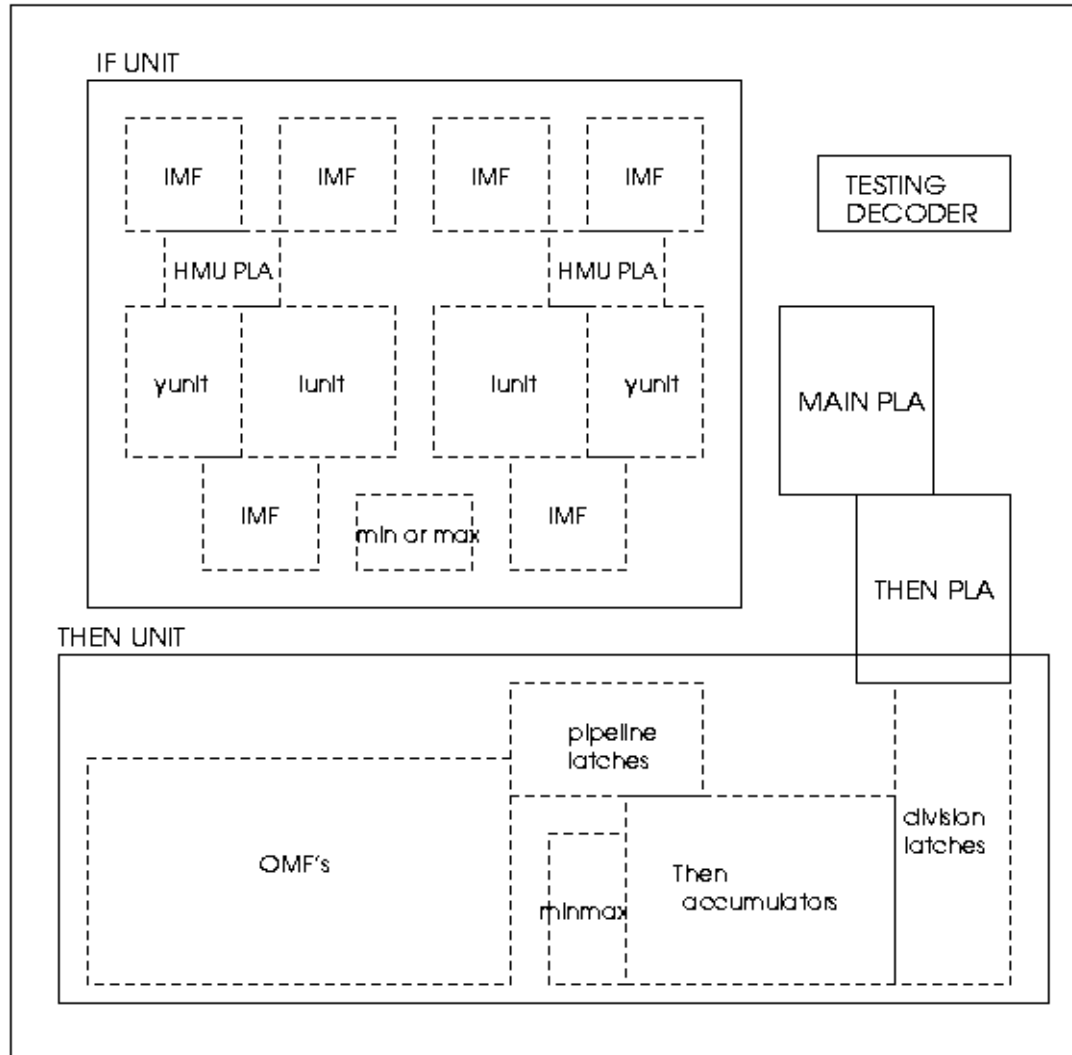

- Fast: Only 17 cycles
- Minimize hardware:
no multipliers needed

- Division:

- Re-use hardware!

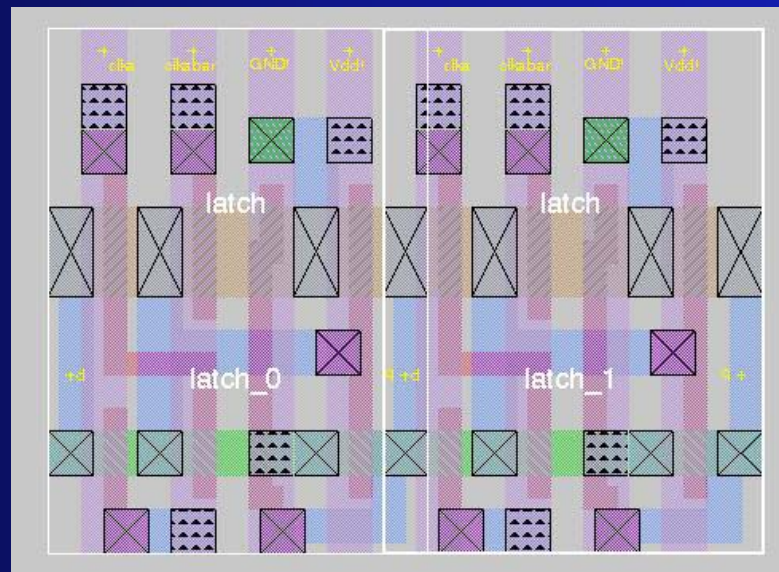

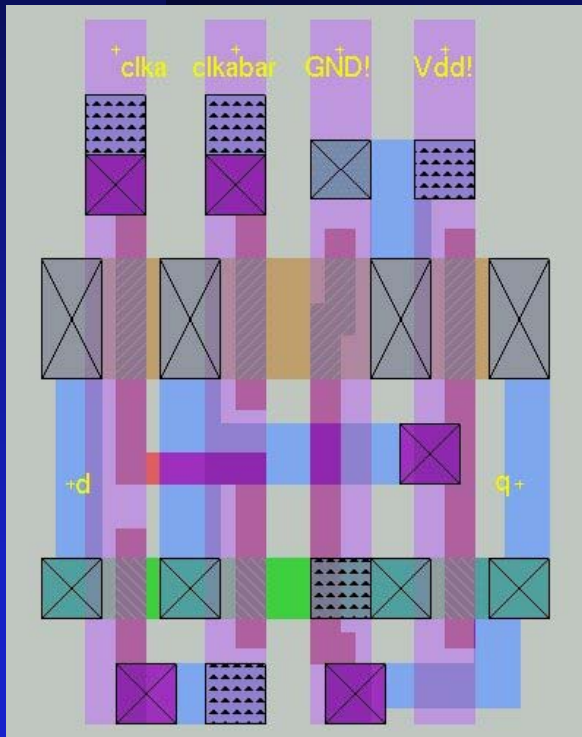

System Floorplan

Standard Cell Layout: LATCH

- Compact
- Scalable in any direction

Full Layout & Status

Design for Test

- Decoder
 - 15 mutually control signals
 - Watch 105 signals total, 7 at a time
 - Asynchronous
- Matlab verification
 - Simulate test vector solutions

Timing Analysis

- Main PLA: 15.72ns -> clock freq: 63MHz
- 11 bit Carry-Select Adder: 14.74ns

Conclusion

- We have:
 - Demonstrated a fuzzy controller that's both FAST and FLEXIBLE
- Applications:
 - Expert system:
 - FuzzyMD
 - Data Mining
 - Real-time:
 - robot control
 - image processing
 - environment control
