## Question #1

### PRS Questions

● Question #1

- Answer to question #1
- Question #2
- Answer to question #2
- Question #3
- Answer to question #3
- Question #4
- Answer to question #4
- Question #5
- Answer to question #5

A net charge  $+Q$  is deposited on an irregularly shaped conductor as shown below. The conductor is allowed to reach equilibrium. What conclusion can be drawn about the electric field at the surface of the conductor?

1. The electric field at the surface of the conductor is zero for every point along the conductor.
2. There is a component of the electric field parallel to the conductor's surface at every point along the conductor.
3. The electric field must be perpendicular to the conductor's surface at every point along the conductor.

## Answer to question #1

- Answer to question #4
- Question #5
- Answer to question #5

A charged particle ( $+q$ ) is moved from infinity to the location denoted P in the figure below. There are no other charges or electric fields present. How much work is required to bring this particle to point P?

1. Zero.
2. Infinite.
3. I can't answer the question because I need more information.

- Answer to question #4
- Question #5
- Answer to question #5

1. At point  $R$ ,  $+Q$  experiences an force directed along a line connecting the two charges.
2. The displacement of  $+Q$  is perpendicular to the electric field (and hence force) generated by  $+q$ .
3. According to the definition of work

$$W = \int \vec{\mathbf{F}} \cdot d\vec{\mathbf{l}}$$

$$W = 0.$$

4. Answer is 1.

NOTE: Surfaces in which moving a charged particle requires no work are called “**equipotential**” surfaces.
