0.1 Flux - General

Question #1

A charge +q is located inside a sphere of radius R. The charge is NOT at the center of the sphere. According to Gauss's Law, which of the following statement(s) is (are) true

- I. The magnitude of the electric field is constant over the surface of the sphere.
- II. The electric flux varies over the surface of the sphere.
- III. The electric flux is constant.
- IV. The electric flux is directly proportional to +q.

- 1. Only I is correct.
- 2. Only II is correct.
- 3. Only III is correct.
- 4. Only II and IV are correct.
- 5. Only III and IV are correct.

Answer to Question #1

- The electric flux is given by $\Phi = \frac{Q_{enclosed}}{\epsilon_0}$.
- Q is the amount of charge contained inside the closed surface (in this case $Q_{enclosed} = +q$).
- Electric flux is constant.
- The answer is 5.

Note: The magnitude of the electric field **magnitude of the electric field** over the spherical surface is not constant **not constant** since the charge **charge** is NOT centered with the sphere. **NOT centered with the sphere.**

0.2 General Equation

Gauss's Law - General

$$\Phi = \oint_S \vec{E} \cdot d\vec{A} = \frac{Q_{\text{enclosed}}}{\epsilon_0} \quad (\text{GAUSS'S LAW})$$

- The above equation is a very general equation and holds true for any surface.
- This is an electric flux law - **NOT AN ELECTRIC FIELD LAW**.
 - Gauss's Law is always true, but the law is NOT always useful in determining electric fields from charge distributions.
 - We will examine the only THREE cases where the law is useful in determining the electric field.

PHYS102

Gauss's Law – slide 4

Applying Gauss's Law

Consider the figure on the right:

- For the arbitrarily shaped surfaces:

$$\Phi_S = \frac{Q_{\text{enclosed}}}{\epsilon_0} = \frac{q_1}{\epsilon_0}$$

$$\Phi_{S'} = \frac{q_2 + q_3}{\epsilon_0}$$

$$\Phi_{S''} = 0$$

- One CANNOT use Gauss's Law to find the electric field due to the charge configuration.

PHYS102

Gauss's Law – slide 5

Spherical Symmetry

1. Spherical Symmetry.

- A charge distribution has *spherical symmetry* if the views of it from all points on the spherical surface are the same.

PHYS102 ○ Choose a spherical surface of radius r , centered at the charge distribution - such surfaces are called "Gaussian surfaces" "Gaussian surfaces"

Gauss's Law – slide 6

Spherical Symmetry

1. Spherical Symmetry.

- By symmetry, the electric field is directed radially (inward if charge distribution is negative or outward if charge distribution is positive).

PHYS102

Gauss's Law – slide 7

Plane Symmetry

2. Plane Symmetry.

- A charge distribution has *plane symmetry* if the views of it from all points on an infinite (or very long) plain surface are the same.
- Choose a soup-can shaped cylinder, with the charged plane bisecting the cylinder.
- The only contributing flux is that due to the flat ends.

PHYS102

Gauss's Law – slide 8

Plane Symmetry

2. Plane Symmetry.

- By symmetry, the electric field is directed perpendicular (away for positive and toward for negative) to the plane.

PHYS102

Gauss's Law – slide 9

Cylindrical Symmetry

3. Cylindrical Symmetry.

- A charge distribution has *cylindrical symmetry* if the views of it from all points on a cylindrical surface of infinite (or very long) length are the same.

PHYS102 ○ Choose a cylindrical Gaussian surface with the center of the Gaussian cylinder coincident with the cylindrical charge distribution.

Gauss's Law – slide 10

Cylindrical Symmetry

3. Cylindrical Symmetry.

- The only contributing flux is along the curved piece of the cylinder.
- By symmetry, the electric field is directed (away for positive or toward for negative) from the line charge.

PHYS102

Gauss's Law – slide 11

- The magnitude of E depends only on the radial distance from the line charge.

0.3 Spherical Symmetry

Spherical Symmetry - Problem

Problem: The volume charge density inside a solid sphere of radius a is given by $\rho = \rho_0 r/a$, where ρ_0 is a constant. Find

- (a). the total charge.
- (b). the electric field strength for $r > a$ and $r < a$.

PHYS102

Gauss's Law – slide 12

Spherical Symmetry - Problem II

- (a). to find the total charge:

$$dq = \rho dV$$

$$Q = \int_0^a \rho dV = \int_0^a \frac{\rho_0 r}{a} 4\pi r^2 dr$$

$$Q = \rho_0 \pi a^3$$

PHYS102

Gauss's Law – slide 13

Spherical Symmetry - Problem III

(b). To find the electric field ($r > a$) first construct a Gaussian surface as shown above and note that the magnitude of the electric field is constant over the sphere.

PHYS102

$$\Phi = \oint \vec{E} \cdot d\vec{A} = E \oint dA = \frac{Q_{\text{enclosed}}}{\epsilon_0} = \frac{\rho_0 \pi a^3}{\epsilon_0}$$

$$\Rightarrow E 4\pi r^2 = \frac{\rho_0 \pi a^3}{\epsilon_0} \Rightarrow E = \frac{\rho_0 a^3}{4\epsilon_0 r^2} \quad (\text{Note: the } 1/r^2 \text{ dependence})$$

Gauss's Law – slide 14

Spherical Symmetry - Problem IV

(b). To find the electric field ($r < a$) first construct a Gaussian surface as shown above and note that the magnitude of the electric field is constant over the sphere.

PHYS102

$$\Phi = \oint \vec{E} \cdot d\vec{A} = E \oint dA = \frac{Q_{\text{enclosed}}}{\epsilon_0} = \frac{\rho_0 \pi r^4}{a \epsilon_0}$$

$$\Rightarrow E 4\pi r^2 = \frac{\rho_0 \pi r^4}{a \epsilon_0} \Rightarrow E = \frac{\rho_0 r^2}{4\epsilon_0 a} \quad (\text{Note: NO } 1/r^2 \text{ dependence})$$

Gauss's Law – slide 15

0.4 Cylindrical Symmetry

Cylindrical Symmetry - Problem

Problem: Find the electric field strength for a very long wire carrying uniform charge density (+λ) as a function of the distance away from wire.

To find the electric field first construct a Gaussian surface as shown above (in blue) and note that the magnitude of the electric field is constant over the cylinder. The electric flux through the Gaussian surface is

$$\Phi = \oint \vec{E} \cdot d\vec{A} = E \oint dA = \frac{Q_{\text{enclosed}}}{\epsilon_0} = \frac{\lambda L}{\epsilon_0}$$

Gauss's Law – slide 16

Cylindrical Symmetry - Problem II

Problem: Find the electric field strength for a very long wire carrying uniform charge density (+λ) as a function of the distance away from wire.

$$\Phi = \oint \vec{E} \cdot d\vec{A} = E \oint dA = \frac{Q_{\text{enclosed}}}{\epsilon_0} = \frac{\lambda L}{\epsilon_0}$$

$$\Rightarrow E 2\pi R L = \frac{\lambda L}{\epsilon_0} \Rightarrow E = \frac{\lambda}{2\pi R \epsilon_0}$$
